Minimax Approximation and Remez Algorithm

Figure 1: Example of a minimax third order polynomial that conforms to the Chebychev criteria The minimax polynomial can be computed analytically up to $n=1$ For higher order a numerical method due to Remez [2] has to be employed Remez algorithm is an iterative algorithm We start the first iteration

FUNCTION APPROXIMATION AND THE REMEZ ALGORITHM

Minimax polynomial and Rational approximations were used for example in the de-sign of FUNPACK in 1970[5] The goal of this paper is to give a brief overview of Minimax approximation and Remez algorithm with the focus on the implementation and how it compares with a competing nonlinear algorithm 1

Finding best minimax approximations with the Remez algorithm

The Remez algorithm is an iterative procedure which can be used to nd best polynomial approximations in the minimax sense We present and explain relevant theory on minimax approximation After doing so, we state the Remez algorithm and give several examples created by our Matlab implementation of the algorithm We conclude by presenting a

CHEBYSHEV APPROXIMATION OF CONTINUOUS FUNCTIONS ...

The second algorithm of Remez can be used to compute the minimax approximation to a function, $f(x)$, by a linear combination of functions, $CQ_i(x)$ which form a Chebyshev system The only restriction on the function to be approximated is that it be continuous on a finite interval $[a,b]$ An Algol 60 procedure is given which will accomplish

The Remez algorithm starts with the function f to be approximated and a set X of $n + 2$ sample points x_1 the minimax approximation polynomial. If not, replace X with M and repeat the steps above. The result is called the polynomial of best approximation, Chebyshev approximation, or

Algorithmic Truncation of MiniMax Polynomial Coefficients

of the minimax polynomials obtained from Remez algorithm using an algorithmic method. A gain of 3 and 4 bits of accuracy over the direct rounding is reported. Muller [2] addressed the same problem but his algorithm is applicable for the second order polynomials only. This paper presents an algorithm that is applicable for any order I .
